Project list

## Arcus :

PRISM: IT and Telecom Expense Intelligence Platform

PRISM is a multi-tenant SaaS portal that gives organizations a clear view of their IT and telecom setup: what they pay for, who provides it, how it's connected and where they can save. It pulls data from a consultancy's Salesforce CRM, reads vendor invoices with AI, and turns all of it into client-facing dashboards, insights and documents.

Key features
IT Expense Management dashboard: monthly and annual spend, possible savings, contracts expiring soon, a full list of services, and spend broken down by service type.
Interactive Enterprise Architecture map: a network diagram you can drag and edit, showing sites, carriers, circuits and cloud endpoints. It lays itself out automatically, can show costs, lets you draw your own shapes, exports to an image or PDF, and saves changes automatically.
IT Heat Map and Readiness Score: places the organization on a bell curve against the industry, with scores for technical feasibility, risk and budget.
AI invoice parsing: upload a PDF or CSV invoice and Claude pulls out the line items. It sorts charges into recurring, usage, prorated, credits and taxes, checks the extracted total against the invoice total, finds duplicates, and flags billing problems for review.
AI-generated insights: an executive summary and recommendations built from the organization's real service and contract data. These run in the background with caching, locking and saved history.
Provider lookup: AI research on vendors, enriched with Crunchbase data. It checks sources, removes unverified links and merges new data with stored data while keeping quality high.
RFP Builder: generates requests for proposal in the background, based on the organization's current services.
Cost benchmarking, dispute tracking and global search.
Enterprise authentication: AWS Cognito with MFA, role-based access (admin, user, internal admin), team invitations with automatic reminders, and switching between client accounts.

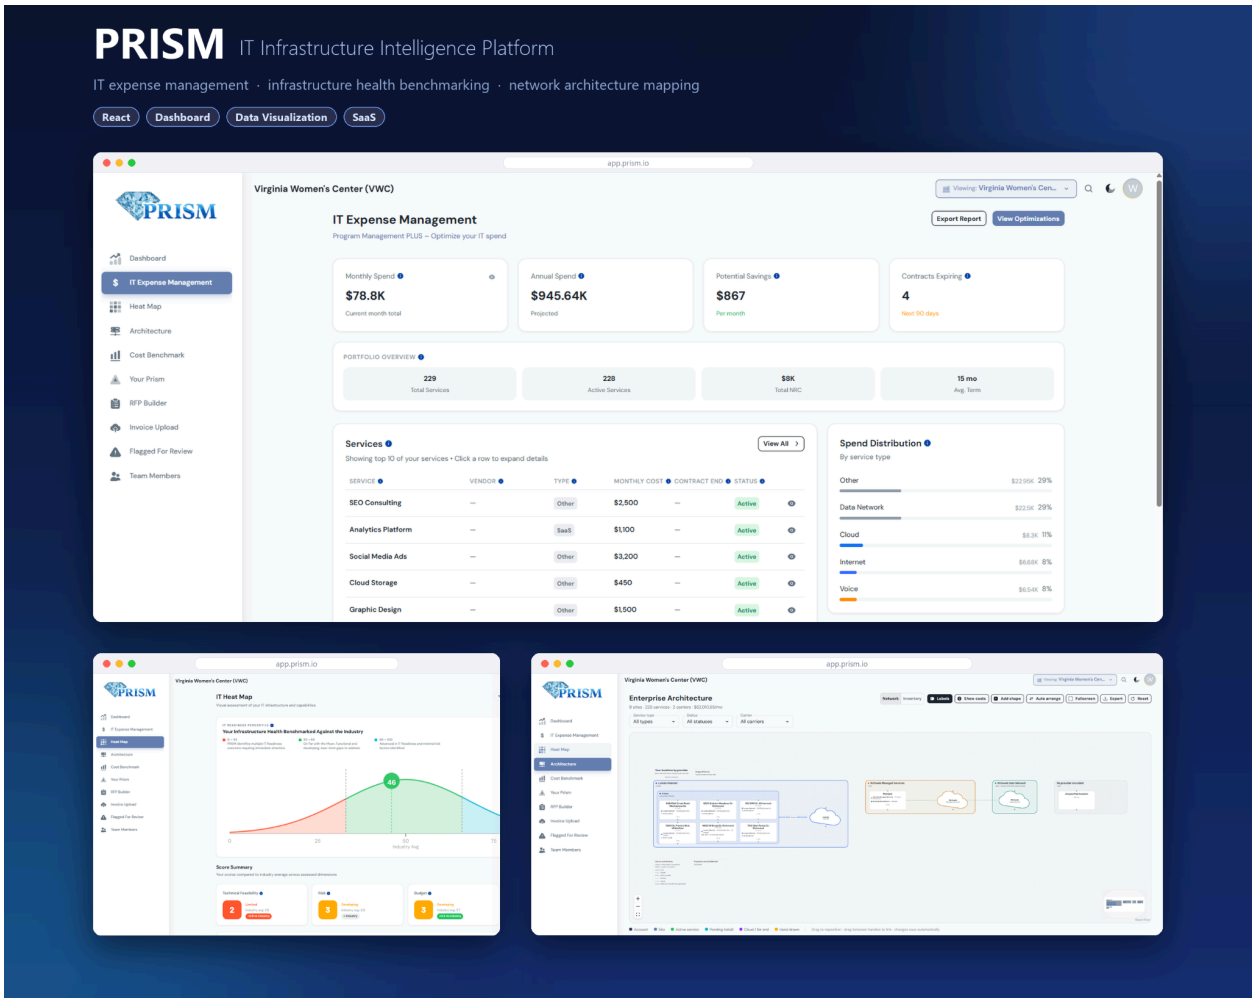

Tech stack

Frontend

React , Vite
AWS Amplify for Cognito authentication and MFA
jsPDF and html-to-image for PDF and image export
ESLint, Prettier; deployed on AWS

Backend

Python 3.11, Django 5, Django REST Framework, Swagger/OpenAPI docs (drf-yasg)
PostgreSQL
Celery with Redis for background jobs and scheduled tasks
Anthropic Claude API for reading documents, generating insights and researching providers
Salesforce integration (simple-salesforce) and the Crunchbase API
AWS: Cognito, S3 (django-storages, boto3) and SES for email
Rate limiting, CORS, encryption (cryptography), Sentry for monitoring

## Buoy :

BuoyHub is an all-in-one business platform combining IT support (BuoyIT), HR, payroll and benefits (BuoyPEO) and customer management (BuoyCRM).

As front-end lead, I built the platform's user interface, including a guided onboarding flow that recommends the right product and plan, plan comparison with monthly/annual pricing, and reusable, responsive components shared across all Buoy products. I also handled API integration, state management and performance optimization.

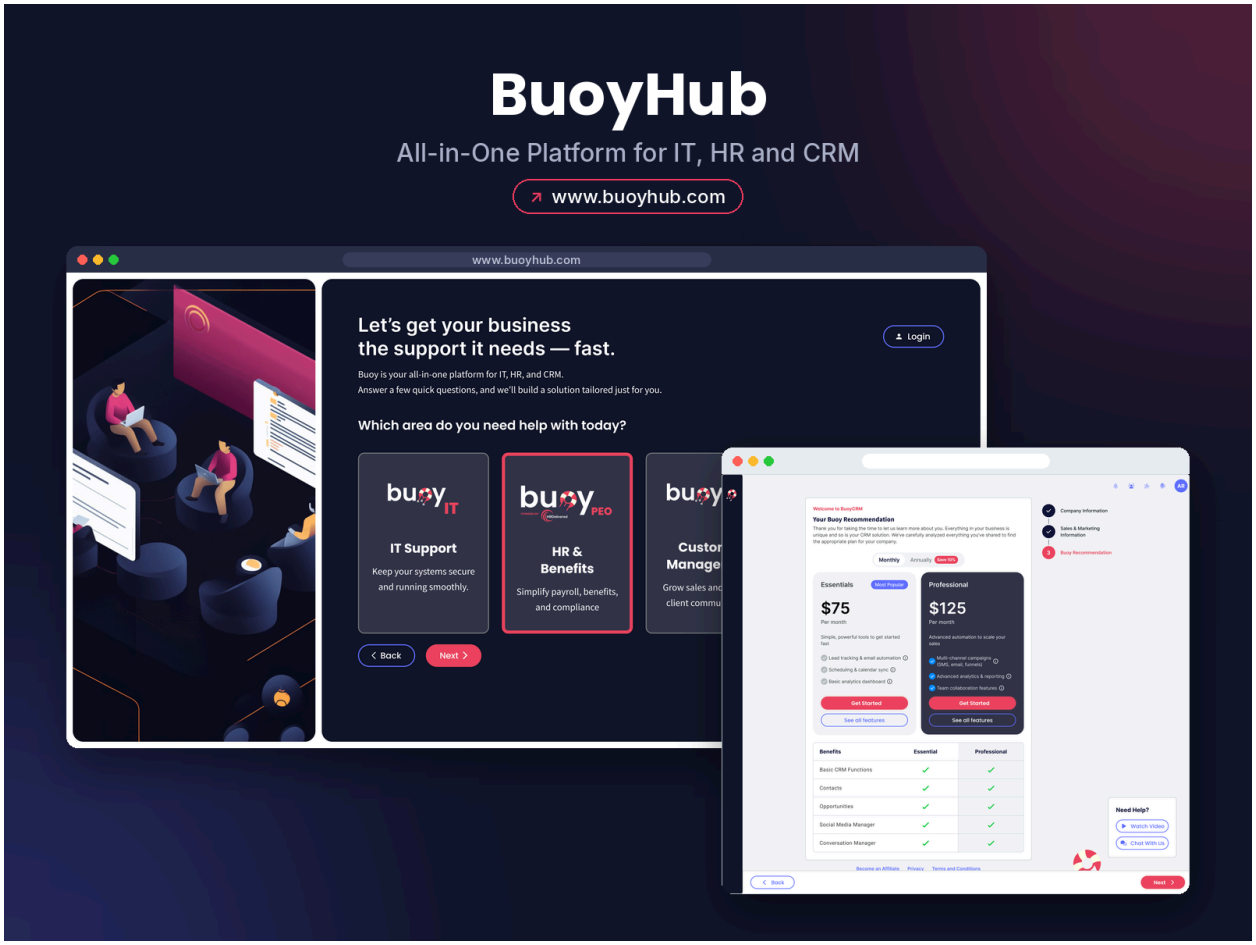

Frontend

React
AWS Amplify for Cognito authentication and MFA
jsPDF and html-to-image for PDF and image export
ESLint, Prettier; deployed on AWS

Backend

Python 3.11, Django 5, Django REST Framework, Swagger/OpenAPI docs (drf-yasg)
PostgreSQL
Salesforce integration (simple-salesforce) and the Crunchbase API
AWS: Cognito, S3 (django-storages, boto3) and SES for email

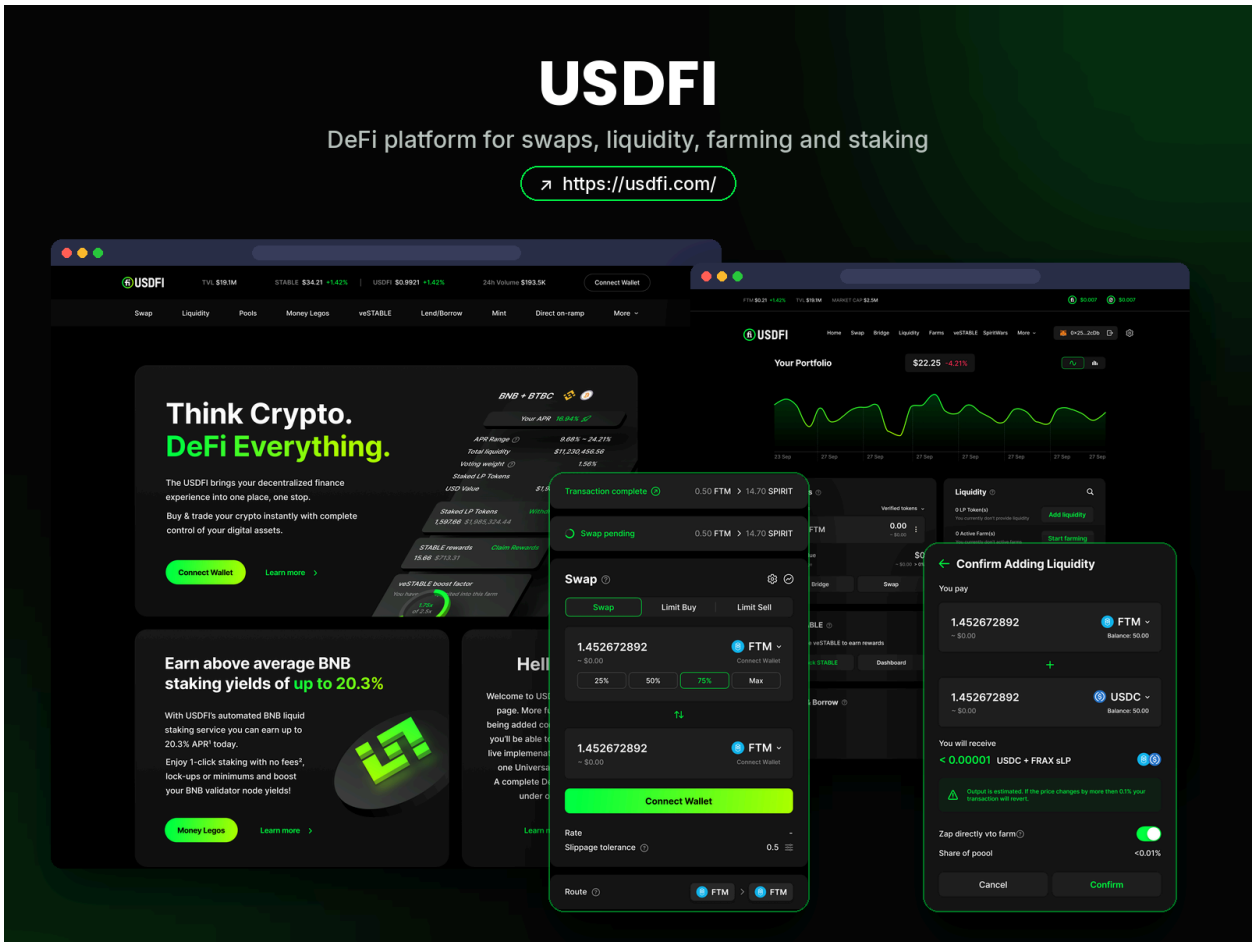

Rate limiting, CORS, encryption (cryptography), Sentry for monitoring

# USDFI

USDFI is a DeFi platform that brings swaps, liquidity pools, farming, staking and portfolio tracking into one place.

I integrated the platform's smart contracts into the web app using Ethers.js, connecting actions like swaps, adding liquidity and claiming rewards to on-chain transactions. I built the wallet integration for connecting wallets, signing transactions and keeping account and network state in sync, and handled transaction states such as pending, confirmed and failed so users always got clear feedback.

Tech stacks

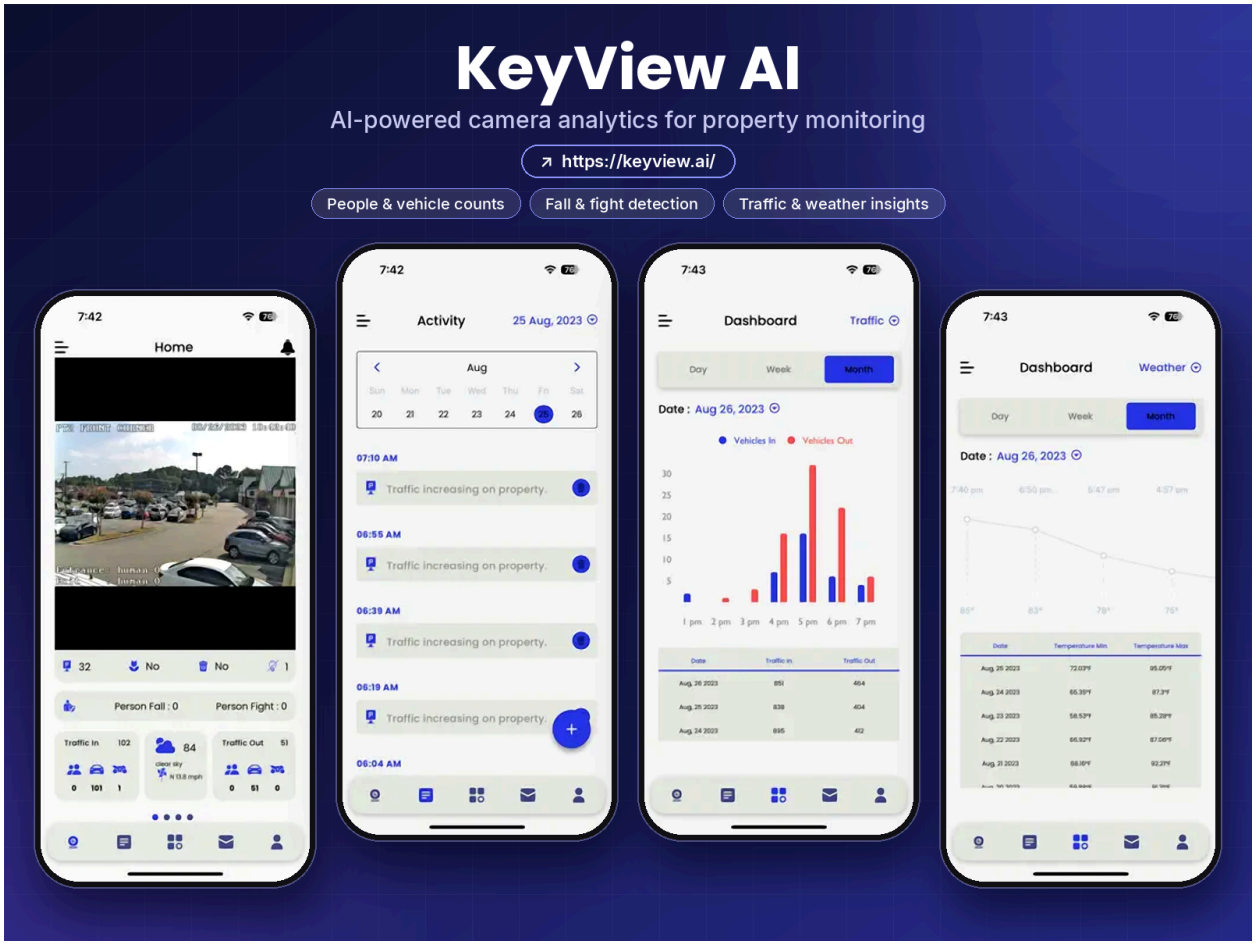

Next js , smart contracts , etherjs , vercel deployment ,

# KeyView Ai

KeyView AI is an iOS app that turns property security cameras into real-time insights using AI video analytics.

Property managers can watch live camera feeds with automatic people and vehicle counts, get alerts for incidents like falls and fights, and track activity through a timeline of events. Dashboards show traffic in and out and weather by day, week or month, with charts and data tables. I built the app's screens, including the live camera view, activity timeline,

analytics dashboards and navigation.

Tech stacks
React  Native , Django , Postgres , open ai , aws

# Snuggle Script

SnuggleScript is an iOS app that turns a child's real day into a personalized, illustrated bedtime story using AI.

Parents type what happened today, or pick a prompt like School Day or Playdate, and the app generates a story starring their child, with AI-created illustrations and read-aloud support. I built the

app's screens and flows, including the home dashboard, story creation, an illustrated story viewer, a reading mode, favorites, ratings and a library of recent stories.

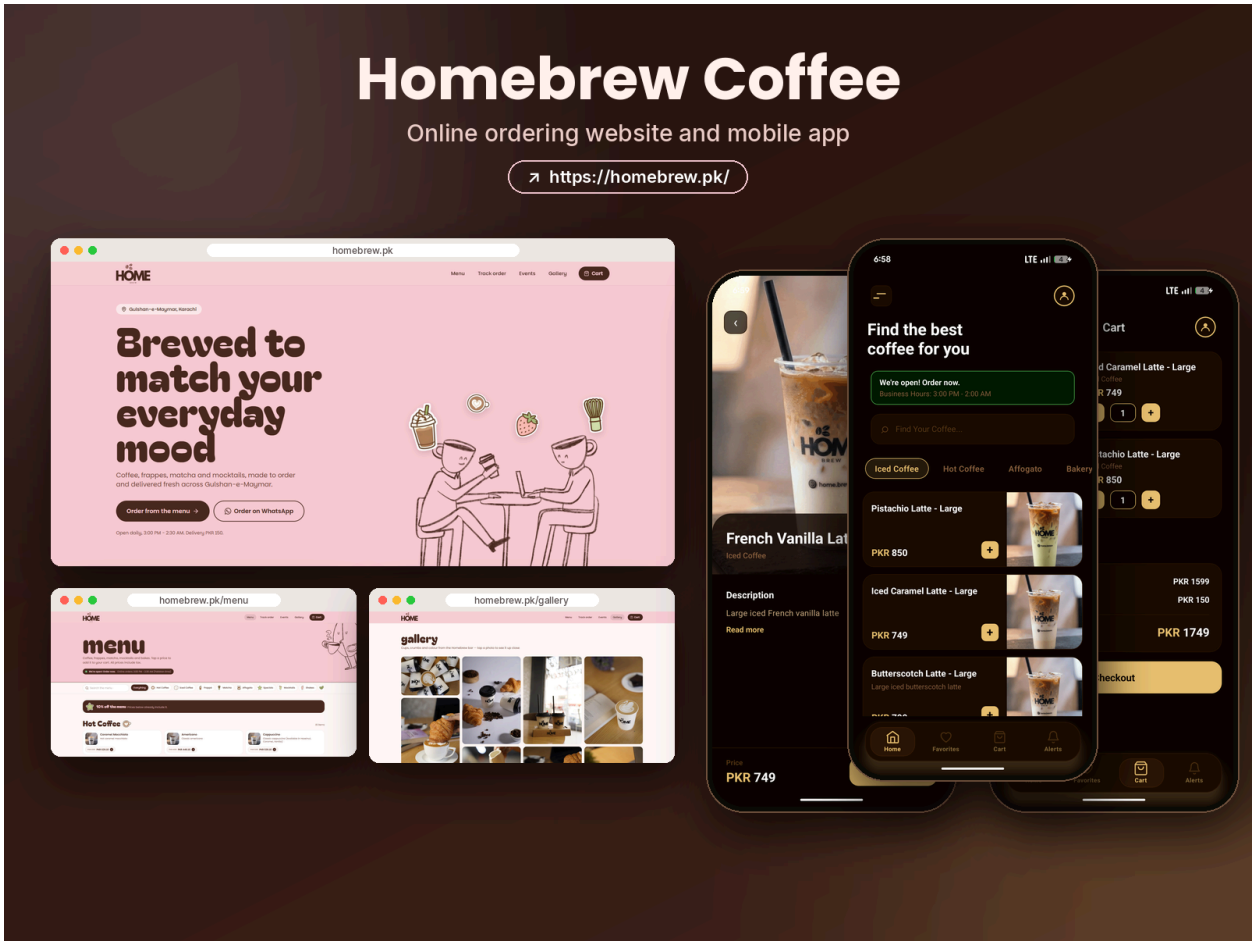

React  Native , Django , Postgres , gemini  ai , aws

# Home Brew Coffee

Homebrew is a coffee bar in Karachi. I built its online ordering website and companion mobile app.

The website includes a searchable menu with categories, discounted pricing, a cart, order tracking, WhatsApp ordering, an events page and a photo gallery, with live opening-hours status. The mobile app lets customers browse the menu by category, view product details, save favorites, manage their cart and check out, with delivery fees calculated automatically and alerts for order updates.

Tech Stacks

React native , next js , supabase

# Lofty E-Learning

Lofty is an e-learning platform, similar to Udemy, where teachers publish courses and students learn at their own pace.

Teachers upload courses with lessons, and students can browse trending and recommended courses, enroll, track their progress and earn a certificate when they complete a course. The app also supports live sessions between teachers and students, with a calendar of upcoming sessions and one-tap joining for sessions in progress. Other features include ratings and reviews, payment methods, purchase history, notifications, language selection and dark mode.

Tech stacks : React Native , Nest js , aws , post gres sql

## Nature Cafe

Full description:

Nature Cafe is a production ordering platform I built for a local cafe and bar. It has three parts that share one Supabase backend: a customer website, a web admin portal, and an Android admin app. A change made in any of them shows up in the others right away.

Customer website (Next.js 16, React 19, TypeScript)

A menu with categories and subcategories, item variants and availability, a deals carousel, and an Instagram section.
A cart and checkout with delivery city and address, a choice of cash on delivery or online transfer, and validation built with React Hook Form and Zod.
Customers can order with an account or as a guest. Guests track their orders by order ID and email through a secure database function.
Ordering is only allowed during opening hours (6 PM to 3 AM, Pakistan time). The time check handles hours that cross midnight.
Web admin portal

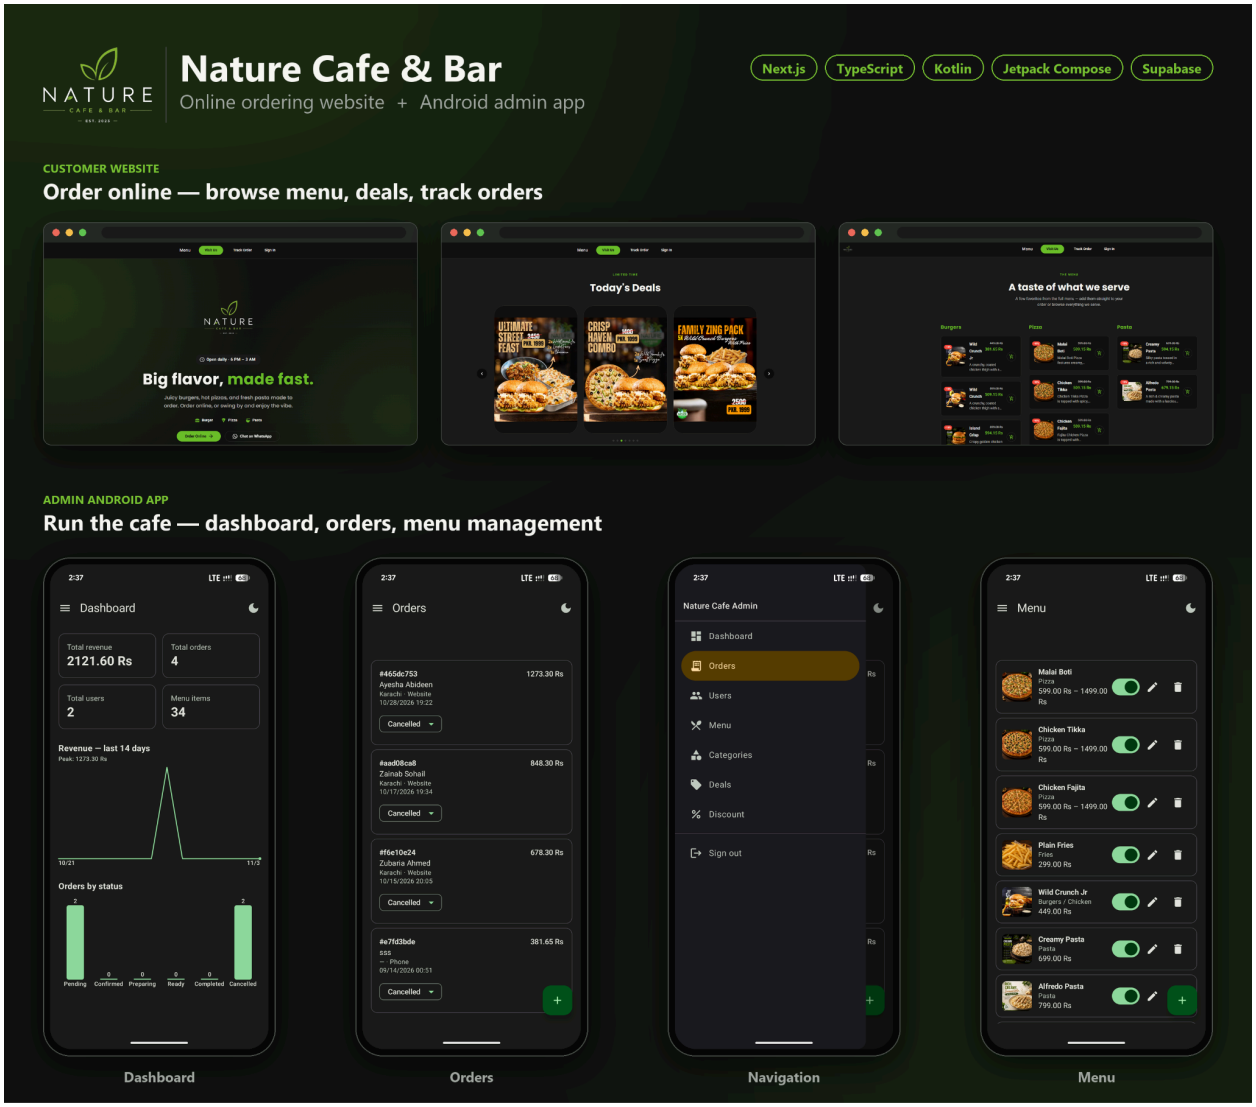

A dashboard with KPI tiles and sales charts (MUI X Charts), and order management with status updates (MUI X Data Grid).
Full management of menu items, categories, deals, discounts and users. Images are uploaded by drag-and-drop.
Staff can log walk-in and phone orders by hand, with the source of each order recorded.
Android admin app (Kotlin, Jetpack Compose, Material 3)

Has the same features as the web admin portal: dashboard, orders, manual orders, menu, categories, deals, discounts and users.
Firebase Cloud Messaging sends a notification the moment an order is placed. The server sends data-only messages, so the app controls how every alert looks, even when it's closed.
Staff can photograph menu items and upload them from their phone. Images are compressed before upload.
Manual orders go to WhatsApp through the portal's API, so no secret keys are stored on the device.
MVVM architecture with repositories and Navigation Compose. It supports Android 7.0 and newer, has light and dark themes, and release builds are signed.
Backend and integrations

Supabase: Postgres with Row-Level Security policies, triggers that calculate order totals, RPC functions, Auth and Storage. The schema is tracked in about 25 versioned SQL migrations.
WhatsApp notifications through the Green API post every new order to the staff group.
Firebase Admin SDK sends push notifications from the server.
Role-based access control on the web (server actions and a proxy layer) and in the app.

Tech stack:

Web: Next.js 16 · React 19 · TypeScript · Material UI · React Hook Form · Zod
Mobile: Kotlin · Jetpack Compose · Material 3 · supabase-kt · Ktor · Coil
Backend: Supabase (Postgres, Auth, Storage, RLS) · Firebase Cloud Messaging · WhatsApp (Green API)

# Frnz

Platform: iOS & Android (React Native, TypeScript)

FRNZ is a location-based social app for meeting new people and finding the busiest places nearby. It shows where people are gathering on a live heatmap. Users can match with others who share their interests, follow friends through photo stories, and chat in real time.

Key Features
Live hotspot heatmap: an interactive map of popular venues and events, a "Hotspots Near You" feed, and detail pages for each venue.
FRNZ Travel: set a virtual location for 2 days to explore hotspots and meet people in a city before you arrive.
Interest-based matching: a short onboarding quiz (music, parties, sports, indoor or outdoor activities) feeds friend suggestions and preference filters.
Stories: take photos with the in-app camera or pick them from the gallery and post them as stories that others can like and comment on.
Friends & chat: send and accept friend requests, view friend profiles, chat one-to-one and block users.
Full account flow: sign-up, login, OTP verification, password reset, profile and photo management, and privacy and notification settings.
Premium subscriptions: paid plans, with a prompt when a subscription expires.
Multi-language support through i18next and device locale detection.
Tech Stack
React Native 0.70 · TypeScript · React Navigation (stack + bottom tabs) · TanStack React Query (with persisted offline cache) · Zustand · MMKV storage · React Hook Form + Yup · Apisauce · react-native-maps & Google Places Autocomplete · Vision Camera · Gifted Chat · Lottie animations · i18next

Highlights
Clean structure: screens only handle the UI, and all logic lives in reusable container hooks (useLoginContainer, useHomeContainer, and others).
Fast and offline-ready: server data is cached with React Query and kept on the device with MMKV, so the app opens quickly.
Shared UI kit: 35+ reusable components (cards, inputs, modals, heatmap, sliders, error boundaries).
Stable in production: app-wide crash handling, network status checks and version checks.

FRNZ

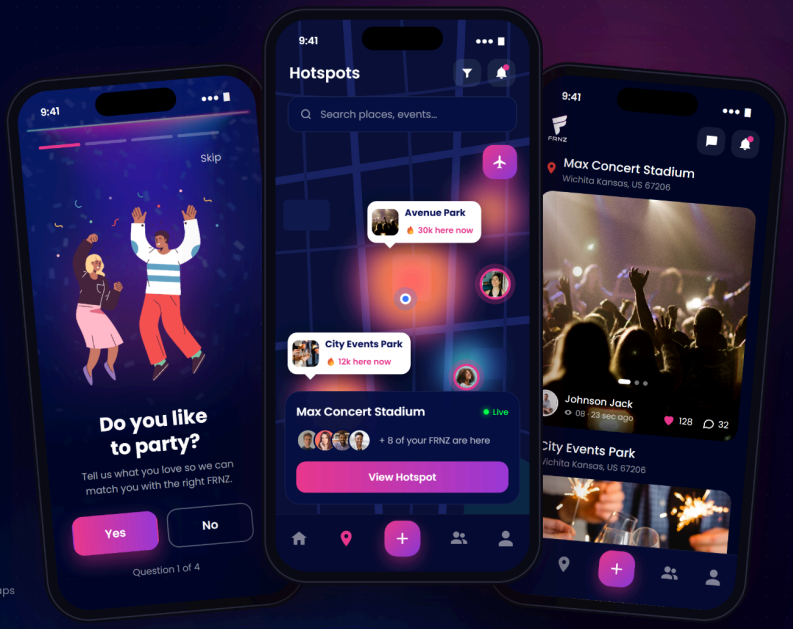

SOCIAL DISCOVERY APP · IOS & ANDROID

# Find where your people are.

FRNZ maps the busiest spots around you on a live heatmap, matches you with friends who share your interests, and lets you share the moment through stories and chat.

## Gyft

Gyft: Corporate Gifting Platform

Gyft is a corporate gifting platform that lets companies send branded gift boxes (custom T-shirts, caps, bottles and other merchandise) to clients and employees, then track each gift until it's delivered. It has three connected applications:

Admin Panel (Web): A dashboard for the platform team. Admins manage business accounts, the product catalog and categories, and gift box contents. They can follow gift and order status from dispatch to delivery, and see stats on accounts, teammates, gifts sent and monthly orders.
Business App (iOS & Android): For companies using Gyft. Business users browse and order gift boxes, manage a cart and payment cards, invite and manage teammates, and track orders. The app includes switchable color themes so each company can match it to its brand.
Sales Rep App (iOS & Android): For sales reps sending gifts to clients. Reps get a password-setup onboarding with OTP verification, then pick a box, choose sizes and colors for each item, and send it to a client. They can track every gift's delivery status and keep a client list with history.
Technologies Used

Admin Panel: React 18, Redux, React Router, Reactstrap / Bootstrap 5, SCSS, ApexCharts, Formik, Axios, i18next
Mobile Apps: React Native 0.68, TypeScript (Sales Rep app), Redux with Redux Thunk and Redux Persist, React Navigation (stack, bottom tabs, drawer), Lottie animations, Linear Gradient, Async Storage
Design: Custom gradient UI with the Poppins font, a responsive layout system scaled to the design spec, and theming support
DevOps: Bitbucket Pipelines for CI/CD, deployed to an Ubuntu server

CORPORATE GIFTING PLATFORM

# Branded gift boxes, sent and tracked from one platform

An admin console for catalog and accounts, a business app for ordering team boxes, and a sales-rep app for sending gyfts and tracking delivery.

- Admin Panel · React
- Business App · React Native
- Sales Rep App · React Native

## Halal Connections :

Halal Connections is a faith-centred matchmaking app that helps Muslims find a spouse in a way that respects Islamic values. Open-ended swiping is replaced by a small set of curated matches, verified profiles, and conversations that can include the user's guardian (wali).

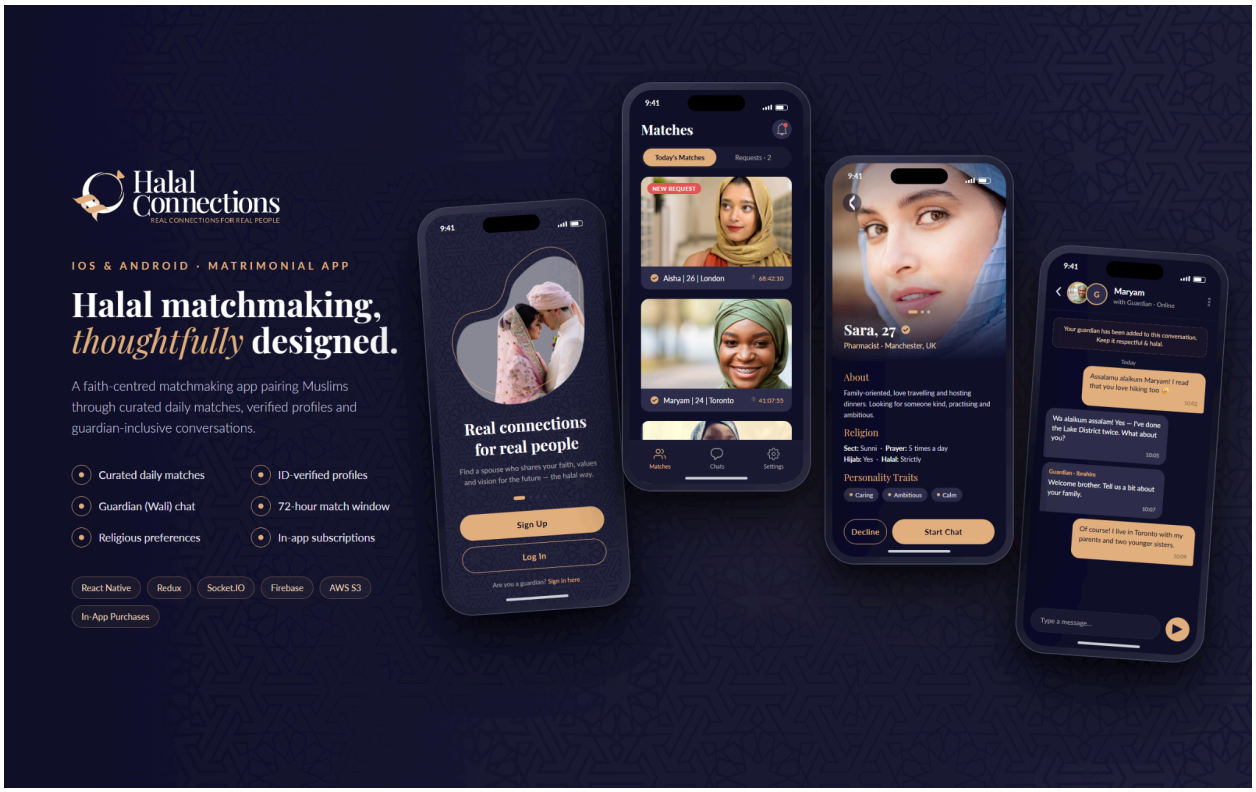

The Challenge
Mainstream dating apps don't fit people looking for marriage within the bounds of their faith. The client wanted an app that is serious rather than casual: it should encourage meaningful conversations, involve family where the user wants that, and build trust through verification.

Key Features
Curated daily matches: users receive a few matches based on detailed personal, professional and religious preferences, including sect, prayer routine, halal preferences and marital status.
72-hour match window: each match request has a live countdown, which pushes users to respond with intent instead of letting matches pile up.
Guardian (Wali) involvement: users can invite a guardian, who has their own login and onboarding and can take part in chats as a group participant.
ID verification: users verify their identity with in-app camera capture of passports or ID cards. Verified profiles show a trust badge.
Real-time chat: messaging over Socket.IO, with chat requests, image sharing, a limit on active conversations, and reporting and moderation tools.
Step-by-step onboarding: a guided flow covering sign-up, profile, personality traits, preferences, ID verification and subscription.
Subscriptions: in-app purchases for iOS and Android, plus card payments.
Sign-in options: email, phone with OTP verification, Google and Apple.
Push notifications: via Firebase Cloud Messaging, with notification settings the user controls.
Design
The interface uses a deep navy and warm gold palette set against a subtle Islamic geometric pattern. Headings use Playfair Display and body text uses Lato, giving the app an elegant, respectful look that sets it apart from typical dating apps.

Tech Stack
React Native · Redux & Redux Thunk · React Navigation · Socket.IO · Firebase Messaging · AWS S3 (media uploads) · React Native IAP · Formik & Yup · Google & Apple Authentication · React Native Camera

My Role

Mobile development of the cross-platform app: building the UI from designs, state management, the real-time chat, the onboarding and verification flows, payment integration and push notifications.

## Instaqoin

A platform for buying and selling Bitcoin and other cryptocurrencies for cash at partner retail locations.

Bitbox lets people buy and sell crypto in a few taps. Users pick a coin, choose an amount, and complete the purchase or sale at a nearby partner store. The platform has two front ends:

A mobile app (iOS and Android) for customers.
A web app for customers, store staff and store admins, with a different set of pages for each role.
Key features
Instant buy and sell: pick a coin, choose a preset amount (1–100) or enter your own, and complete the order at the nearest partner location.
Live prices: the current BTC rate and an interactive price-history chart.
Store locator: finds nearby partner stores using the phone's location and Google Places search.
Identity checks (KYC): in-app ID verification with Onfido, plus Social Security Number collection for regulated transactions.
QR code payments: scan a QR code to confirm wallet transactions.
Transaction history: totals bought and sold, status tracking (completed, pending, cancelled) and details for each transaction.
Real-time updates: push notifications through Firebase Cloud Messaging and live updates over Socket.IO.
Support tickets: users can create and track tickets with priority levels.
Store operator tools (web): a wallet with bank accounts linked through Plaid, staff management and transaction tracking per store.
Secure login: sign up and sign in, OTP verification, password reset, and sessions that stay saved between visits.
Technology Stack
Mobile App

React Native (iOS and Android)
Redux, Redux Thunk, Redux Persist and Immutable.js
React Navigation (stack and bottom tabs)
Reanimated, Gesture Handler and Reanimated Bottom Sheet
Rainbow Animated Charts (price charts)
Formik and Yup (forms and validation)
Firebase Cloud Messaging (push notifications)
Socket.IO (real-time updates)

Onfido SDK (identity verification)
Google Places, Geocoding and Geolocation
QR Code Scanner, Image Crop Picker
AWS S3 (file uploads)
Web App

React with React Router
Redux, Redux Saga, Redux Thunk and Redux Persist (with encryption)
Reactstrap, Bootstrap 4 and SCSS
ApexCharts and Chart.js (charts)
Firebase (web push notifications)
Socket.IO
Onfido Web SDK (identity verification)
Plaid Link (bank account linking)
Google Maps
Axios, i18next (translations), React Dropzone
Integrations: Firebase, AWS S3, Onfido, Plaid, Google Maps Platform, Socket.IO

## Tutor Pin

TutorPin connects students with tutors for quick, written help on specific questions. It has three account types: students post questions, tutors answer them and get paid, and guardians follow their children's progress. There's a responsive web app and a cross-platform mobile app.

Key features

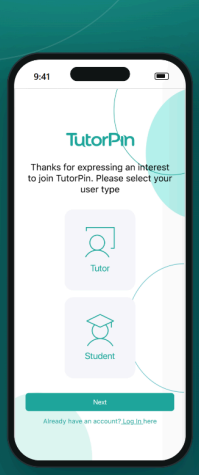

Question board: students ask questions by subject, can mark them as urgent, and attach images, audio, video or PDFs. Tutors answer in threads that support follow-up and clarity questions, and students can rate answers.
Knowledge bank: tutors organise reusable teaching resources (images, audio, video, PDFs) by subject and topic, and can share them with students.
Tutor earnings & billing: dashboards with earnings charts and monthly and weekly trends, bank account management, withdrawals and downloadable reports.
Student wallet: students buy time packages per subject and track their remaining balance.
Networks & invites: tutors invite students and guardians, and the platform manages the links between tutors, students and guardians.
Productivity & account tools: a to-do list, notifications, profile and notification settings, and reporting of users or technical issues, with an appeals flow.
Onboarding by account type: sign-up with subject selection, a profile photo and a tutor video introduction, plus email verification.
Tech stack

Web: React, Redux (with Thunk and encrypted redux-persist), React Router, Bootstrap/Reactstrap, SCSS, ApexCharts
Mobile: React Native, React Navigation (stack + bottom tabs), Redux, Formik + Yup, react-native-svg, Chart Kit, plus native camera, media and document integrations
Backend: a REST API, node js , aws

## Swift Sales :

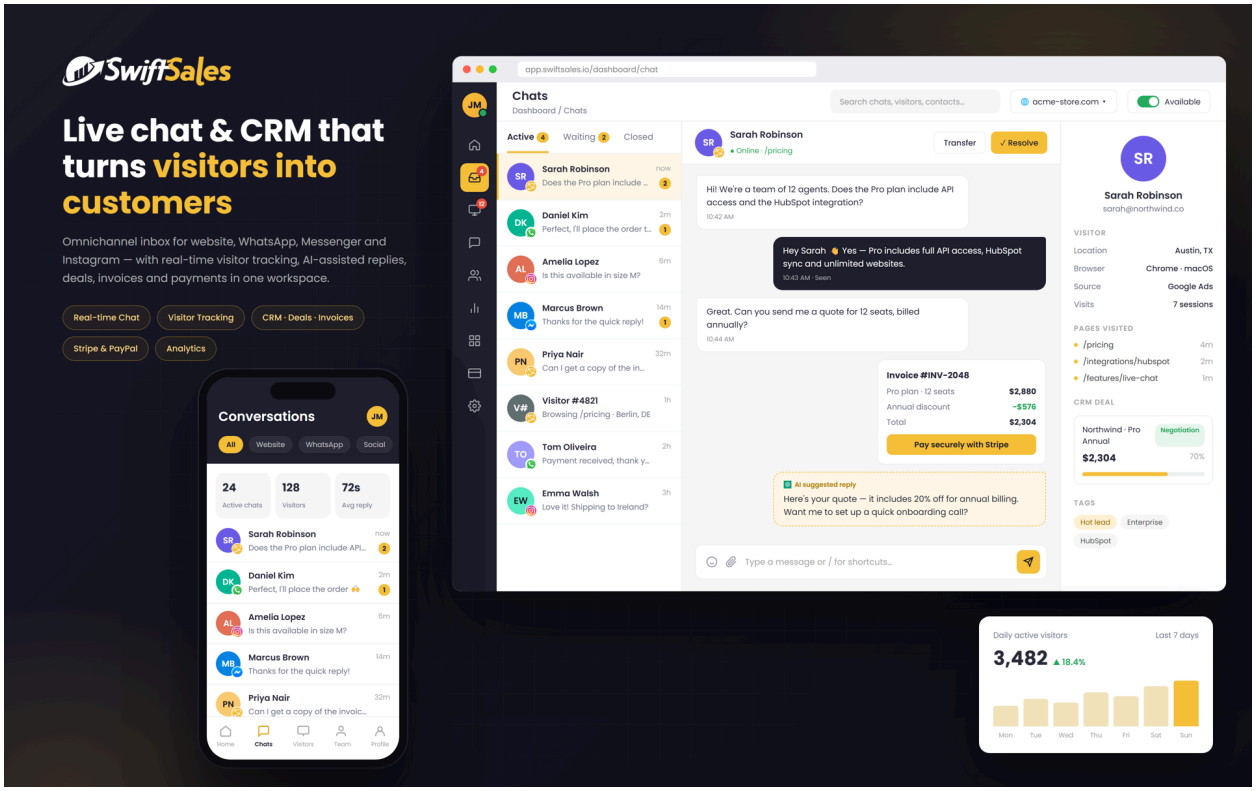

SwiftSales is a customer engagement platform for sales and support teams. Agents can chat with website visitors and social media customers in real time, follow up on leads in a built-in CRM, and get paid, all from one dashboard. It comes as a web app and a mobile app for iOS and Android.

Key Features
Omnichannel inbox: website live chat, WhatsApp, Facebook Messenger and Instagram messages in a single queue (Active, Waiting and Closed chats)
Real-time visitor tracking: see who is on the website live, with their location, browser, traffic source and the pages they've viewed
Visitor inbox and offline messages: capture leads even when no agent is online
Built-in CRM: contacts, deals and invoices, with custom fields, custom statuses and activity logs
Payments: send invoices in the chat and collect payment through Stripe, PayPal or Authorize.net
AI-assisted replies: ChatGPT suggestions help agents answer faster
Screen sharing: peer-to-peer co-browsing with visitors for hands-on support
Team chat: internal messaging with @mentions, emoji, file attachments and pinned messages
Analytics: daily and monthly active users, plus extra engagement reports
Integrations marketplace: HubSpot, QuickBooks, PayPal, Authorize.net and Stripe
Agents and roles: invite agents, set access levels, show availability, and manage more than one website or account
Subscription billing: pricing plans that unlock features per plan
Multi-language: English, Spanish and Arabic, with right-to-left layout support
Mobile app: push notifications, chat on the go, visitor monitoring and team chat
Technology Stack
Web app

React 17, Redux, Redux Thunk, Redux Persist
React Router, Formik and Yup for forms
Webpack Module Federation (micro-frontend architecture) through CRACO, with the CRM shipped as a separate remote app
Socket.IO for real-time messaging and presence

PeerJS (WebRTC) for screen sharing
Stripe.js and React Stripe Elements
Chart.js and Google Charts for analytics, Google Maps for visitor locations
React Quill rich text editor with mentions and emoji (Emoji Mart)
Bootstrap, SCSS and styled-components
Docker, Nginx and Bitbucket Pipelines for CI/CD
Mobile app (iOS and Android)

React Native with TypeScript
React Navigation (stack and bottom tabs)
Redux and TanStack React Query
React Hook Form and Yup
Socket.IO for real-time chat
Firebase Cloud Messaging and Dynamic Links, plus native push notifications
Reanimated, Gesture Handler, Bottom Sheet and FlashList for smooth, fast UI
React Native Maps, image picker and cropper, document picker
i18next for translations

## TaskFox Services

TaskFox is a home services marketplace in the UAE. Customers use it to book cleaning professionals in a few clicks. The platform has three apps that share one backend: a customer website, a customer mobile app for iOS and Android, and an admin panel for running day-to-day operations.

Customers pick a service: home, deep, sofa, carpet, mattress, curtain or kitchen cleaning, or a special request. They choose a one-time or recurring visit (weekly or every two weeks), set the hours, number of professionals and whether cleaning materials are needed, and select a date and time slot. Then they pay online by card or with prepaid TaskFox credit. Prices update live as they change options, and promo codes are applied at checkout. After a visit, customers can reschedule or cancel bookings, manage saved addresses and cards, top up their wallet, and rate the service.

Key Features
Step-by-step booking: Frequency → Service details → Date & time → Payment, with a price summary that updates as you go
Location-based service: pick your address on a Google Map with place search
Payments: Stripe card payments, saved cards, wallet top-up packages, transaction history and promo codes
Bookings: view, reschedule and cancel appointments, and leave reviews
Multiple languages: English and Arabic with right-to-left layout on web; Kurdish added on mobile
Push notifications through Firebase Cloud Messaging
Social login on mobile with Google, Facebook and Apple, plus phone verification by one-time code
In-app chat between customers and support
Admin panel: dashboard with analytics, bookings, customers, agents (cleaning staff) and their availability calendars, services and service availability, locations, payments, promo codes, top-up packages, banners and promotions, reviews and app settings
Tech Stack
Web app: React 17, Redux, Redux Thunk, Redux Persist (encrypted), React Router, Stripe.js, Google Maps API, Firebase Cloud Messaging, i18next, React Datepicker, React Toastify

Mobile app: React Native 0.63, React Navigation 5, Redux, Redux Saga, Redux Persist, Immutable.js, Tipsi Stripe, React Native Maps, Google Places Autocomplete, React Native Firebase, Google / Facebook / Apple sign-in, Gifted Chat, i18next

Admin panel: React, Redux, Redux Saga, Redux Form, Reactstrap / Bootstrap 4, ApexCharts, Chart.js, ECharts, FullCalendar, React Bootstrap Table, Google Maps, Firebase

Tooling: Bitbucket Pipelines (CI/CD), ESLint, Prettier, Husky, Jest
